

Statement of Basis

**Permit to Construct No. P-2017.0055
Project ID 61952**

**Rule Steel
Caldwell, Idaho**

Facility ID 027-00156

Draft for Facility Review

**DRAFT XX, 2018
Rakael Pope
Permit Writer**

The purpose of this Statement of Basis is to satisfy the requirements of IDAPA 58.01.01. et seq, Rules for the Control of Air Pollution in Idaho, for issuing air permits.

ACRONYMS, UNITS, AND CHEMICAL NOMENCLATURE

AAC	acceptable ambient concentrations
AACC	acceptable ambient concentrations for carcinogens
acfm	actual cubic feet per minute
BMP	best management practices
Btu	British thermal units
CAA	Clean Air Act
CAS No.	Chemical Abstracts Service registry number
cfm	cubic feet per minute
CFR	Code of Federal Regulations
CMS	continuous monitoring systems
CO	carbon monoxide
CO ₂	carbon dioxide
CO ₂ e	CO ₂ equivalent emissions
DEQ	Department of Environmental Quality
dscf	dry standard cubic feet
EL	screening emission levels
EPA	U.S. Environmental Protection Agency
GACT	Generally Available Control Technology
GHG	greenhouse gases
GP	General Provisions
gph	gallons per hour
gpm	gallons per minute
HAP	hazardous air pollutants
hp	horsepower
hr/yr	hours per consecutive 12 calendar month period
HVLP	high-volume, low-pressure spray gun
IDAPA	a numbering designation for all administrative rules in Idaho promulgated in accordance with the Idaho Administrative Procedures Act
km	kilometers
lb/hr	pounds per hour
LPG	Liquified Petroleum Gas
m	meters
MMBtu	million British thermal units
MMscf	million standard cubic feet
NAAQS	National Ambient Air Quality Standard
NESHAP	National Emission Standards for Hazardous Air Pollutants
NO ₂	nitrogen dioxide
NO _x	nitrogen oxides
NSPS	New Source Performance Standards
O&M	operation and maintenance
Fl Oz	Fluid ounce
O ₂	oxygen
PAH	polyaromatic hydrocarbons
PC	permit condition
PM	particulate matter
PM _{2.5}	particulate matter with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers
PM ₁₀	particulate matter with an aerodynamic diameter less than or equal to a nominal 10 micrometers
POM	polycyclic organic matter
ppm	parts per million
ppmw	parts per million by weight
PSD	Prevention of Significant Deterioration

PTC	permit to construct
PTE	potential to emit
PW	process weight rate
<i>Rules</i>	<i>Rules for the Control of Air Pollution in Idaho</i>
scf	standard cubic feet
SIP	State Implementation Plan
SM	synthetic minor
SM80	synthetic minor facility with emissions greater than or equal to 80% of a major source threshold
SO ₂	sulfur dioxide
SO _x	sulfur oxides
T/day	tons per calendar day
T/hr	tons per hour
T/yr	tons per consecutive 12 calendar month period
TAP	toxic air pollutants
ULSD	ultra-low sulfur diesel
VOC	volatile organic compounds

FACILITY INFORMATION

Description

Rule Steel operates an existing steel fabrication and manufacturing facility which is located on Bass Lane in Caldwell, ID. At this facility, various forms of raw materials are received including steel (primarily carbon steel and smaller amounts of stainless steel), ancillary parts, electrical components, paints, thinners, welding electrodes, welding gases, and support chemicals (such as solvents, oils, and lubricants). These raw materials are machined into industrial grinders, light gauge storage boxes, and containers, and structural steel tanks, dumpsters, storage bins, and structural steel components. Facility operations include two plasma cutters, abrasive blasting, welding, two paint booths, and nine portable space heaters. The plasma cutting operations emissions were calculated based on use of indoor recirculating air filtration units which are being installed in the Plasma Cutting Shop.

Rules steel is consolidating operations from their nearby shops near Middleton Road in Caldwell to this main facility on Bass Lane. The Bass Lane facility will include the following structures:

Plant 1 (Diamond Z Shop): contains stations for machining, welding, and cutting steel associated with industrial grinders.

Plant 2 (Plasma Cutting Shop): contains two plasma cutters.

Plant 3 (Structural Shop): contains welding, cutting, and grinding stations for fabricating structural steel.

Plant 4 (Handrail Shop): Welding and cutting for fabricating handrails

Outdoor Tent (Quonset Hut Structure): previously used to control emissions from primer application to structural steel

Abrasive Blasting Area: Partially enclosed area for abrasive blasting

Container Shop: to be used to fabricate various containers (seed bins, trash containers, etc.)

Tank Shop: Will be used to fabricate various storage tanks

Paint Booths: Two paint booths will be installed to control emissions from painting products manufactured/fabricated at the facility. One of the booths will be relocated from Rule Steel operations near Middleton Road.

Permitting History

This is the initial PTC for an existing facility that was previously constructed, thus there is no permitting history.

Application Scope

This permit is the initial PTC for this facility. The applicant has applied for a permit for their steel fabrication and manufacturing facility.

Application Chronology

August 5, 2017	DEQ sent a notice of violation to the facility, which included notification that a PTC was required (Enforcement Case No. E-2017.0015).
October 31, 2017	DEQ received an application and an application fee.
November 06 – November 21, 2017	DEQ provided an opportunity to request a public comment period on the application and proposed permitting action.
December 1, 2017	DEQ determined that the application was incomplete.
June 19, 2018	DEQ received supplemental information from the applicant.
July 6, 2018	DEQ determined that the application was complete.

August 7, 2018	DEQ made available the draft permit and statement of basis for peer and regional office review.
August 10, 2018	DEQ made available the draft permit and statement of basis for applicant review.
October XX – November XX, 2018	DEQ provided a public comment period on the proposed action.
September 28, 2018	DEQ received the permit processing fee.
Month XX, Year	DEQ issued the final permit and statement of basis.

Emissions Inventories

Potential to Emit

IDAPA 58.01.01 defines Potential to Emit as the maximum capacity of a facility or stationary source to emit an air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the facility or source to emit an air pollutant, including air pollution control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed, shall be treated as part of its design if the limitation or the effect it would have on emissions is state or federally enforceable. Secondary emissions do not count in determining the potential to emit of a facility or stationary source.

Using this definition of Potential to Emit an emission inventory was developed for the welding, abrasive blasting, plasma cutting, and coating operations at the facility (see Appendix A) associated with this proposed project. Emissions estimates of criteria pollutant, HAP PTE were based on emission factors from AP-42, operation of 8,760 hours per year, and process information specific to the facility for this proposed project. Hand grinders were listed in Table 1, but deemed insignificant because they are listed in a "List of Activities that May be Treated as Trivial", from a July 10, 1995 EPA memorandum titled *White Paper for Streamlined Development of Part 70 Permit Applications*.

Uncontrolled Potential to Emit

Using the definition of Potential to Emit, uncontrolled Potential to Emit is then defined as the maximum capacity of a facility or stationary source to emit an air pollutant under its physical and operational design. Any physical or operational limitation on the capacity of the facility or source to emit an air pollutant, including air pollution

control equipment and restrictions on hours of operation or on the type or amount of material combusted, stored or processed, shall **not** be treated as part of its design **since** the limitation or the effect it would have on emissions **is not** state or federally enforceable.

The uncontrolled Potential to Emit is used to determine if a facility is a “Synthetic Minor” source of emissions. Synthetic Minor sources are facilities that have an uncontrolled Potential to Emit for regulated air pollutants or HAP above the applicable Major Source threshold without permit limits.

The following table presents the uncontrolled Potential to Emit for regulated air pollutants as submitted by the Applicant and verified by DEQ staff. See Appendix A for a detailed presentation of the calculations and the assumptions used to determine emissions for each emissions unit. For this steel fabrication and manufacturing operation, uncontrolled Potential to Emit is based upon a worst-case for operation of the facility of 8,760 hr/yr.

Table 2 UNCONTROLLED POTENTIAL TO EMIT FOR REGULATED AIR POLLUTANTS

Source	PM ₁₀ /PM _{2.5}	SO ₂	NO _x	CO	VOC
	T/yr	T/yr	T/yr	T/yr	T/yr
Plasma Cutting	29.86	0.00	3.34	0.00	0.00
Welding	0.90	0.00	0.00	0.00	0.00
Abrasive Blasting	0.38	0.00	0.00	0.00	0.00
Coating	52.50	0.00	0.00	0.00	40.74
Heaters	0.04	0.08	0.65	0.38	0.05
Hand Grinders	<i>Insignificant</i>				
Total, Point Sources	83.68	0.08	3.99	0.38	40.79

The following table presents the uncontrolled Potential to Emit for HAP pollutants as submitted by the Applicant and verified by DEQ staff. See Appendix A for a detailed presentation of the calculations and the assumptions used to determine emissions for each emissions unit. For this steel fabrication and manufacturing operation, uncontrolled Potential to Emit is based upon a worst-case for operation of the facility of 8,760 hr/yr. Then, the worst-case maximum HAP Potential to Emit was determined.

Table 3 UNCONTROLLED POTENTIAL TO EMIT FOR HAZARDOUS AIR POLLUTANTS

Hazardous Air Pollutants	PTE (T/yr)
Butanone	0.76
Chromium (VI)	9.25E-05
Chromium total	0.41
Cobalt	6.40E-05
Cobalt 2-ethylhexanoate	2.40E-02
Cumene	0.01
Dibutyl Phthalate	5.87E-04

Manganese	0.73
Methyl Isobutyl Ketone	0.28
Naphthalene	1.61E-02
Nickel and Nickel Oxide	0.26
Toluene	5.85
Triethylamine	1.60E-02
Xylene	8.03
o-Xylene	1.15
Total	19.34

Pre-Project Potential to Emit

Pre-project Potential to Emit is used to establish the change in emissions at a facility as a result of this project. This is an existing facility. However, since this is the first time the facility is receiving a permit, pre-project emissions are set to zero for all criteria pollutants.

Post Project Potential to Emit

Post project Potential to Emit is used to establish the change in emissions at a facility and to determine the facility’s classification as a result of this project. Post project Potential to Emit includes all permit limits resulting from this project.

The following table presents the post project Potential to Emit for criteria pollutants from all emissions units at the facility as determined by DEQ staff. See Appendix A for a detailed presentation of the calculations of these emissions for each emissions unit.

Table 4 POST PROJECT POTENTIAL TO EMIT FOR REGULATED AIR POLLUTANTS

Source	PM ₁₀ /PM _{2.5}		SO ₂		NO _x		CO		VOC	
	lb/hr ^(a)	T/yr ^(b)	lb/hr ^(a)	T/yr ^(b)	lb/hr ^(a)	T/yr ^(b)	lb/hr ^(a)	T/yr ^(b)	lb/hr ^(a)	T/yr ^(b)
Plasma	0.01	0.01	0.00	0.00	1.09	3.34	0.00	0.00	0.00	0.00
Welding	0.10	0.45	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Abrasive Blasting	0.27	0.38	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Coating	0.08	0.03	0.00	0.00	0.00	0.00	0.00	0.00	53.78	40.74
Heaters	0.01	0.04	0.03	0.08	0.22	0.65	0.13	0.38	0.02	0.05
Hand Grinders	<i>Insignificant</i>									
Post Project Totals	0.47	0.91	0.03	0.08	1.31	3.99	0.13	0.38	53.80	40.79

- a) Controlled average emission rate in pounds per hour is a daily average, based on the proposed daily operating schedule and daily limits.
- b) Controlled average emission rate in tons per year is an annual average, based on the proposed annual operating schedule and annual limits.

Change in Potential to Emit

The change in facility-wide potential to emit is used to determine if a public comment period may be required and to determine the processing fee per IDAPA 58.01.01.225. The following table presents the facility-wide change in the potential to emit for criteria pollutants.

Table 5 CHANGES IN POTENTIAL TO EMIT FOR REGULATED AIR POLLUTANTS

Source	PM ₁₀ /PM _{2.5}		SO ₂		NO _x		CO		VOC	
	lb/hr	T/yr	lb/hr	T/yr	lb/hr	T/yr	lb/hr	T/yr	lb/hr	T/yr
Pre-Project Potential to Emit	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00	0.00
Post Project Potential to Emit	0.47	0.91	0.03	0.08	1.31	3.99	0.13	0.38	53.80	40.79
Changes in Potential to Emit	0.47	0.91	0.03	0.08	1.31	3.99	0.13	0.38	53.80	40.79

Non-Carcinogenic TAP Emissions

A summary of the estimated PTE for emissions of non-carcinogenic toxic air pollutants (TAP) is provided in the following table.

Table 6 PROJECT POTENTIAL TO EMIT FOR NON-CARCINOGENIC TOXIC AIR POLLUTANTS

Non-Carcinogenic Toxic Air Pollutants	24-hour Average Emissions Rates for Units at the Facility (lb/hr)	Non-Carcinogenic Screening Emission Level (lb/hr)	Exceeds Screening Level? (Y/N)
1-Butanol	0.32	10	No
1-Methoxy-2-Propanol Acetate	5.47	24	No
2-Methoxymethylethoxypropanol	0.48	40	No
Acetone	26.18	119	No
Aluminum	0.02	0.667	No
Butanone	26.18	39.3	Yes
Calcium Carbonate	0.02	0.667	Yes
Calcium Oxide	0.06	0.133	No
Carbon Black	1.53E-03	0.23	No
Chromium total	2.01E-04	0.033	No
Cobalt	7.30E-06	0.0033	No
Copper	6.14E-05	0.013	No
Crystalline Silica, respirable powder	3.74E-04	0.0067	No
Cumene	1.06	16.3	No
Dibutyl Phthalate	1.76	0.333	Yes
Ethanol	0.06	125	No
Ethylbenzene	8.07	29	No
heptan-2-one	52.37	15.7	Yes
Iron Oxide	0.08	0.333	No
Magnesium Oxide	1.10E-02	0.667	No
Manganese	4.49E-03	0.333	No
Methyl Isobutyl Ketone	9.55	13.7	No
Molybdenum	1.39E-05	0.333	No
Naphthalene	3.20	3.33	No
n-Butyl Acetate	19.87	47.3	No
Phosphorus	4.06E-06	0.007	No
Silicates - Amorphous	0.39	0.667	No
Silicon	5.49E-05	0.667	No
Stoddard Solvent	0.62	35	No
Toluene	17.42	25	No
Triethylamine	0.13	0.27	No
Vanadium	1.28E-06	0.067	No
Xylene	47.50	29	Yes
Zinc Oxide	1.47E-03	0.333	No

Some of the PTEs for non-carcinogenic TAP were exceeded as a result of this project. Therefore, modeling was required for butanone, calcium carbonate, dibutyl phthalate, heptan-2-one, and xylene because the 24-hour average non-carcinogenic screening ELs identified in IDAPA 58.01.01.585 were exceeded.

Carcinogenic TAP Emissions

A summary of the estimated PTE for emissions of carcinogenic toxic air pollutants (TAP) is provided in the following table.

Table 7 PROJECT POTENTIAL TO EMIT FOR CARCINOGENIC TOXIC AIR POLLUTANTS

Carcinogenic Toxic Air Pollutants	Annual Average Emissions Rates for Units at the Facility (lb/hr)	Carcinogenic Screening Emission Level (lb/hr)	Exceeds Screening Level? (Y/N)
Chromium (VI)	2.29E-07	5.60E-07	No
Naphthalene (PAH)	3.67E-03	9.10E-05	Yes
Nickel and Nickel Oxide	6.00E-05	2.70E-05	Yes

The PTEs for carcinogenic TAPs naphthalene (PAH) and nickel/nickel oxide were exceeded as a result of this project. Therefore, modeling is required for naphthalene and nickel/nickel oxide because the annual average carcinogenic screening ELs identified in IDAPA 58.01.01.586 were exceeded.

Post Project HAP Emissions

The following table presents the post project potential to emit for HAP pollutants from all emissions units at the facility as submitted by the Applicant and verified by DEQ staff. See Appendix A for a detailed presentation of the calculations of these emissions for each emissions unit.

Table 8 HAZARDOUS AIR POLLUTANTS EMISSIONS POTENTIAL TO EMIT SUMMARY

Hazardous Air Pollutants	PTE (T/yr)
Butanone	0.76
Chromium	4.41E-04
Chromium (VI)	1.00E-06
Cobalt	3.20E-05
Cobalt 2-ethylhexanoate	0.02
Cumene	0.10
Dibutyl Phthalate	5.87E-04
Ethylbenzene	1.80
Manganese	0.02
Methyl Isobutyl Ketone	0.28
Naphthalene	0.02
Nickel	2.63E-04
Toluene	5.85
Triethylamine	0.02
Xylene	9.18
Totals	18.05

Ambient Air Quality Impact Analyses

As presented in the Modeling Memo in Appendix B, the estimated emission rates of VOC and TAP from this project exceeded applicable screening emission levels (EL) and published DEQ modeling thresholds established in IDAPA 58.01.01.585-586 and in the State of Idaho Air Quality Modeling Guideline¹. Refer to the Emissions Inventories section for additional information concerning the emission inventories.

The applicant has demonstrated pre-construction compliance to DEQ’s satisfaction that emissions from this facility will not cause or significantly contribute to a violation of any ambient air quality standard. The applicant has also demonstrated pre-construction compliance to DEQ’s satisfaction that the emissions increase due to this permitting action will not exceed any acceptable ambient concentration (AAC) or acceptable ambient concentration for carcinogens (AACC) for toxic air pollutants (TAP). A summary of the Ambient Air Impact Analysis for TAPs is provided in Appendix A and B.

¹ Criteria pollutant thresholds in Table 2, State of Idaho Guideline for Performing Air Quality Impact Analyses, Doc ID AQ-011, September 2013.

An ambient air quality impact analyses document has been crafted by DEQ based on a review of the modeling analysis submitted in the application. That document is part of the final permit package for this permitting action (see Appendix B).

REGULATORY ANALYSIS

Attainment Designation (40 CFR 81.313)

The facility is located in Canyon County, which is designated as attainment or unclassifiable for PM_{2.5}, PM₁₀, SO₂, NO₂, CO, and Ozone. Refer to 40 CFR 81.313 for additional information.

Facility Classification

The AIRS/AFS facility classification codes are as follows:

For HAPs (Hazardous Air Pollutants) Only:

- A = Use when any one HAP has permitted emissions > 10 T/yr or if the aggregate of all HAPS (Total HAPs) has permitted emissions > 25 T/yr.
- SM80 = Use if a synthetic minor (uncontrolled HAPs emissions are > 10 T/yr or if the aggregate of all uncontrolled HAPs (Total HAPs) emissions are > 25 T/yr and permitted emissions fall below applicable major source thresholds) and the permit sets limits > 8 T/yr of a single HAP or ≥ 20 T/yr of Total HAPs.
- SM = Use if a synthetic minor (uncontrolled HAPs emissions are > 10 T/yr or if the aggregate of all uncontrolled HAPs (Total HAPs) emissions are > 25 T/yr and permitted emissions fall below applicable major source thresholds) and the permit sets limits < 8 T/yr of a single HAP and/or < 20 T/yr of Total HAPs.
- B = Use when the potential to emit (i.e. uncontrolled emissions and permitted emissions) are below the 10 and 25 T/yr HAP major source thresholds.
- UNK = Class is unknown

For All Other Pollutants:

- A = Use when permitted emissions of a pollutant are > 100 T/yr.
- SM80 = Use if a synthetic minor for the applicable pollutant (uncontrolled emissions are > 100 T/yr and permitted emissions fall below 100 T/yr) and permitted emissions of the pollutant are ≥ 80 T/yr.
- SM = Use if a synthetic minor for the applicable pollutant (uncontrolled emissions are > 100 T/yr and permitted emissions fall below 100 T/yr) and permitted emissions of the pollutant are < 80 T/yr.
- B = Use when the potential to emit (i.e. uncontrolled emissions and permitted emissions) are below the 100 T/yr major source threshold.
- UNK = Class is unknown.

Table 9 REGULATED AIR POLLUTANT FACILITY CLASSIFICATION

Pollutant	Uncontrolled PTE (T/yr)	Permitted PTE (T/yr)	Major Source Thresholds (T/yr)	AIRS/AFS Classification
PM	113.93	1.33	100	SM
PM ₁₀	83.66	0.91	100	B
PM _{2.5}	83.32	0.57	100	B
SO ₂	0.08	0.08	100	B
NO _x	3.99	3.99	100	B
CO	0.38	0.38	100	B
VOC	40.79	40.79	100	B
HAP (single)	9.18	9.18	10	B
HAP (total)	19.24	18.05	25	B
Pb	0.18	0.0009	100	B

Permit to Construct (IDAPA 58.01.01.201)

IDAPA 58.01.01.201 Permit to Construct Required

A PTC is required for this existing steel fabrication facility in accordance with Section 7.C of the October 12, 2017 Consent Order agreement between DEQ and Rule Steel.

Tier II Operating Permit (IDAPA 58.01.01.401)

IDAPA 58.01.01.401 Tier II Operating Permit

The application was submitted for a permit to construct (refer to the Permit to Construct section), and an optional Tier II operating permit has not been requested. Therefore, the procedures of IDAPA 58.01.01.400–410 were not applicable to this permitting action.

Visible Emissions (IDAPA 58.01.01.625)

IDAPA 58.01.01.625 Visible Emissions

The sources of PM emissions at this facility are subject to the State of Idaho visible emissions standard of 20% opacity. This requirement is assured by Permit Conditions 2.4, 3.4, 4.4 and 5.4.

Fugitive Particulate Matter Emissions (IDAPA 58.01.01.650-651)

IDAPA 58.01.01.650 Rules for Control of Fugitive Dust

All reasonable precautions shall be taken to prevent the generation of fugitive dust. This requirement is assured by Permit Conditions 4.8.

Fuel Burning Equipment – Particulate Matter (IDAPA 58.01.01.675-676)

IDAPA 58.01.01.676 Standards for New Sources

The facility is subject to particulate matter emissions not to exceed 0.015 gr/dscf.

Rules for Control of Odors (IDAPA 58.01.01.775-776)

IDAPA 58.01.01.776 Rules for the Control of Odors

The facility is subject to the general restrictions for the control of odors from the facility. This requirement is assured by Permit Condition 5.5.

Particulate Matter – Process Weight Limitations (IDAPA 58.01.01.700-701)

IDAPA 58.01.01.701 Particulate Matter – New Equipment Process Weight Limitations

In accordance with IDAPA 58.01.01.700.02, no source shall be required to meet an emission limit of less than 1 lb/hr as determined based on process weight rate. Reasonable control of fugitive emissions and compliance with emission limits for coating operations (Permit Conditions 2.3, 3.3, 4.3, and 5.3) were considered adequate to ensure compliance with the facility-wide process weight-based PM emission limitation. The BRC threshold for PM_{2.5} is more stringent than the minimum allowable process weight-based PM emission limit specified in IDAPA 58.01.01.700.02

Title V Classification (IDAPA 58.01.01.300, 40 CFR Part 70)

IDAPA 58.01.01.301 Requirement to Obtain Tier I Operating Permit

Post project facility-wide emissions from this facility do not have a potential to emit greater than 100 tons per year for PM₁₀, SO₂, NO_x, CO, VOC, and HAP or 10 tons per year for any one HAP or 25 tons per year for all HAP combined as demonstrated previously in the Emissions Inventories Section of this analysis. Therefore, the facility is not a Tier I source in accordance with IDAPA 58.01.01.006 and the requirements of IDAPA 58.01.01.301 do not apply.

PSD Classification (40 CFR 52.21)

40 CFR 52.21 Prevention of Significant Deterioration of Air Quality

The facility is not a major stationary source as defined in 40 CFR 52.21(b)(1), nor is it undergoing any physical change at a stationary source not otherwise qualifying under paragraph 40 CFR 52.21(b)(1) as a major stationary source, that would constitute a major stationary source by itself as defined in 40 CFR 52. Therefore in accordance with 40 CFR 52.21(a)(2), PSD requirements are not applicable to this permitting action. The facility is not a designated facility as defined in 40 CFR 52.21(b)(1)(i)(a), and does not have facility-wide emissions of any criteria pollutant that exceed 250 T/yr.

NSPS Applicability (40 CFR 60)

New Source Performance Standards (NSPS) are nationally uniform standards applied to specific categories of stationary sources that are constructed, modified, or reconstructed after the standard was promulgated. NSPS are found in 40 CFR, Part 60, and usually represent a minimum level of control that is required on a new source. The following NSPS regulation was reviewed and determined to not apply to the Caldwell facility, as discussed in the following section.

40 CFR 60, Subpart SS..... Standards of Performance for Industrial Surface Coating: Large Appliances

Determination of applicability of this NSPS subpart to a proposed source within the Idaho Department of Environmental Quality (DEQ) jurisdiction has been delegated by EPA to DEQ.

This subpart is applicable to each surface coating operation in a large appliance surface coating line. Specifically, a surface coating line applying organic surface coatings to large appliance parts (i.e., lid, door, casing, and panel) or large appliance product (i.e., range, oven, microwave, refrigerator, freezer, washer, dryer, dishwasher, water heater, or trash compactor). Rule Steel is not subject to this subpart because the facility does not apply surface coatings to large appliance parts or products.

40 CFR 60, Subpart A Standards of Performance for Industrial Surface Coating: Large Appliances

Any stationary source that is subject to any NSPS regulation is also subject to the general notification, recordkeeping, and monitoring requirements of the NSPS General Provisions, unless the applicable Part 60 Subpart regulation specifically exempts the source from the provisions of Subpart A. Because Rule Steel’s operations are not subject to NSPS rules, the General Provisions in 40 CFR 60, Subpart A do not apply.

NESHAP Applicability (40 CFR 61)

The proposed source is not an affected source subject to NESHAP in 40 CFR 61, and this permitting action does not alter the applicability status of existing affected sources at the facility.

MACT/GACT Applicability (40 CFR 63)

The facility has proposed to operate as a minor source of hazardous air pollutant (HAP) emissions, and may be subject to the requirements of 40 CFR 63, Subpart HHHHHH–National Emission Standards for Hazardous Air Pollutants: Paint Stripping and Miscellaneous Surface Coating Operations at Area Sources. DEQ is also delegated this Subpart.

40 CFR 63, Subpart HHHHHH..... National Emission Standards for Hazardous Air Pollutants: Paint Stripping and Miscellaneous Surface Coating Operations at Area Sources

§ 63.11169 What is the purpose of this subpart?

In accordance with §63.11169, subpart HHHHHH establishes national emission standards for hazardous air pollutants (HAP) for area sources involved in paint stripping operations that involve the use of chemical strippers that contain methylene chloride in paint removal processes or spray application of coatings containing compounds

of chromium (Cr), lead (Pb), manganese (Mn), nickel (Ni), or cadmium (Cd), collectively referred to as the target HAP to any part or product made of metal or plastic, or combinations of metal and plastic that are not motor vehicles or mobile equipment.

§ 63.11170..... Am I subject to this subpart?

Rule Steel performs spray application of coatings, as defined in §63.11180, to fabricated steel parts including operations that are located in stationary structures at fixed locations. Rule Steel does not perform paint stripping using methylene chloride. Rule Steel is not a major source of HAP, is not located at a major source, and is not part of a major source of HAP emissions.

Also, Rule Steel submitted a petition for exemption from 40 CFR §63.11180 to the U.S. EPA January 20, 2017. A response was issued by the EPA Region 10 Stationary Source Manager dated July 21, 2017. The exemption letter indicates that, based on the signed certification that none of the coatings sprayed at the Rule Steel Caldwell facility contain the target HAP, EPA accepted the petition for exemption from 40 CFR Part 63 Subpart HHHHHH. Consequently, these requirements do not currently apply to Rule Steel’s Caldwell facility.

Rule Steel has proposed to operate welding, plasma cutting and blasting operations on carbon steel and stainless steel, and may be subject to the requirements of 40 CFR 63, Subpart XXXXXX–National Emission Standards for Hazardous Air Pollutants: Area Source Standards for Nine Metal Fabrication and Finishing Source Categories.

40 CFR 63, Subpart XXXXXX..... National Emission Standards for Hazardous Air Pollutants: Area Source Standards for Nine Metal Fabrication and Finishing Source Categories

§ 63.11169..... What is the purpose of this subpart?

In accordance with §63.11522, subpart XXXXXX establishes national emission standards for hazardous air pollutants (HAP) for area sources involved in one of the nine source categories in metal fabrication and finishing operations listed in 40 CFR 63 Subpart XXXXXX Table 1.

§ 63.11170..... Am I subject to this subpart?

A facility is subject to the published rule if the facility owns or operates an area source that is primarily engaged in the operations in one of the nine source categories:

1. Electrical and Electronic Equipment Finishing Operations;
2. Fabricated Metal Products;
3. Fabricated Plate Work (Boiler Shops);
4. Fabricated Structural Metal Manufacturing;
5. Heating Equipment, except Electric;
6. Industrial Machinery and Equipment Finishing Operations;
7. Iron and Steel Forging;
8. Primary Metal Products Manufacturing; and
9. Valves and Pipe Fittings.

From the October 24, 2016 DEQ AQ-C7 Inspection report:

Rule Steel metal fabrication operations are included under the nine manufacturing subcategories regulated by Table 1, Subpart XXXXXX of 40 CFR 63. On April 14, 2017, DEQ received a letter from Rule Steel via hand delivery to the DEQ state office front desk. In the letter, Rule Steel concluded they utilize appropriate SIC and NAICS codes for their business segments, and the facility is not subject to regulation under Subpart 6X because the facility is not primarily engaged in any of the activities covered by listed source categories. Although DEQ believes other SIC/NAICS codes for the Grinders and Grinder parts (3531/333120) are a better description of the source category than those currently used by Rule Steel, DEQ has determined that the definition of primarily engaged in 40 CFR 63.11522 should be strictly interpreted to mean the facility must be primarily engaged in one source category. The definition simply states that primarily engaged “means the manufacturing, fabricating, or forging of one or more products listed in one of the nine metal fabrication and finishing source category descriptions...” The definition does not state that primarily engaged includes an aggregate of the categories. Since the revenue from each of the three identified source categories are all less than 50% of the total revenue,

Rule Steel is not primarily engaged in any one source category for the purposes of 40 CFR 63 Subpart XXXXXX, and the appropriateness of specific SIC/NAICS codes becomes a moot issue. Therefore, after consulting with DEQ's Stationary Source Program and Idaho Attorney General's office, I (Zach) concur with Rule Steel's conclusion that 40 CFR 63 Subpart XXXXXX is not applicable to Rule Steel's operations under their current product mix. However, Subpart XXXXXX may become applicable in the future if the revenue from one product (source category), such as structural steel manufacturing or grinders, becomes greater than 50% of the facilities total revenue. DEQ has not consulted with EPA Region 10 regarding the applicability determination. Therefore, 40 CFR 63, Subpart XXXXXX is not applicable to Rule Steel's metal fabrications and finishing operations, at this time.

The facility has proposed to operate coating operations on carbon steel and stainless steel, and may be subject to the requirements of 40 CFR 63, Subpart MMMM–National Emission Standards for Hazardous Air Pollutants: Surface Coating of Miscellaneous Metal Parts and Products.

40 CFR 63, Subpart MMMM..... National Emission Standards for Hazardous Air Pollutants:
Surface Coating of Miscellaneous Metal Parts and Products

§ 63.3880..... What is the purpose of this subpart?

In accordance with §63.3890, subpart MMMM establishes national emission standards for hazardous air pollutants (HAP) for area sources involved in miscellaneous metal parts and products surface coating facilities.

§ 63.3881..... Am I subject to this subpart?

This rule is applicable to a miscellaneous metal parts and products surface coating facility that uses two hundred fifty gallons per year or more of coatings that contain hazardous air pollutants and is a major source, or is located at a major source, or is part of a major source of HAP emissions. Rule Steel does use more than two hundred fifty gallons per year or more of coatings that contain hazardous air pollutants but is not a major source of HAP emissions. Therefore, this subpart does not apply to Rule Steel.

40 CFR 63, Subpart A Standards of Performance for Industrial Surface Coating: Large Appliances

Any stationary source that is subject to any 40 CFR 63 NESHAP regulation is also subject to the general notification, monitoring, performance testing, reporting and recordkeeping, and operation and maintenance requirements of the NESHAP General Provisions, unless the applicable Part 63 Subpart regulation specifically exempts the source from the provisions of Subpart A. Because the operations at Rule Steel are not subject to any 40 CFR 63 NESHAP rules at this time, the General Provisions of Subpart A do not apply.

Permit Conditions Review

This section describes the permit conditions for this initial permit.

Initial Permit Condition 1.1

Permit Condition 1.1 describes this is an initial permit to construct for Rule Steel. Table 1.1 lists Rule Steel's regulated sources and applicable control equipment, if any, as was provided by the applicant.

Initial Permit Condition 2.1 and 2.2

Permit Condition 2.1 describes Plasma Cutting operations and 2.2 lists the plasma cutters, their controls, and emission points.

Initial Permit Condition 2.3 and 2.4

Permit Condition 2.3 lists emission limits for the plasma cutting operations and 2.4 has the opacity limit requirements.

Initial Permit Condition 2.5, 2.6, 2.7, 2.8, and 2.9

Permit Condition 2.5, 2.6, 2.7, 2.8, and 2.9 list the operating requirements for Plasma Cutting operations including a yearly throughput limit, material restriction, water bath requirements, and filtration system use requirement.

Initial Permit Condition 2.10, 2.11, 2.12, and 2.13

Permit Condition 2.10 through 2.13 describe the monitoring and recordkeeping requirements of plasma cutting operations and the air filtration system.

Initial Permit Condition 3.1 and 3.2

Permit Condition 3.1 describes welding operations and 3.2 lists welders, control, and emission points.

Initial Permit Condition 3.3 and 3.4

Permit Condition 3.3 describes welding emission limits and 3.4 has welding opacity requirements.

Initial Permit Condition 3.5 and 3.6

Permit Condition 3.5 and 3.6 include operating requirements for welding including closed door requirements and throughput limits for permitted electrode material limits.

Initial Permit Condition 3.7, 3.8, and 3.9

Permit Condition 3.7, 3.8, and 3.9 describe the monitoring and recordkeeping requirements for the welding operations.

Initial Permit Condition 4.1 and 4.2

Permit Condition 4.1 describes abrasive blasting operation and 4.2 lists the abrasive blaster, controls, and emission points.

Initial Permit Condition 4.3 and 4.4

Permit Condition 4.3 describes abrasive blasting operation emission limits and 4.4 has opacity requirements.

Initial Permit Condition 4.5, 4.6, 4.7, and 4.8

Permit Conditions 4.5, 4.6, 4.7 and 4.8 contain the operating requirements for abrasive blasting including throughput limits, blasting media content requirements, and fugitive emissions.

Initial Permit Condition 4.9, 4.10, and 4.11

Permit Conditions 4.9, 4.10, and 4.11 contain monitoring and recordkeeping requirements for daily and annual throughput monitoring.

Initial Permit Condition 5.1 and 5.2

Permit Condition 5.1 describes coating operations and 5.2 lists the paint booths with their control devices and emission points.

Initial Permit Condition 5.3, 5.4, and 5.5

Permit Condition 5.3 contains coating operations emission limits. Permit conditions 5.3 and 5.4 contain opacity and odor requirements.

Initial Permit Condition 5.6

Permit Condition 5.6 contains annual coating usage limits in Table 5.3, which also lists coating groups and permitted coatings contained in those groups.

Initial Permit Condition 5.7

Permit Condition 5.7 contains the approved daily coating usage scenario with daily limits.

Initial Permit Condition 5.8

Permit Condition 5.8 contains spray gun requirements.

Initial Permit Condition 5.9 and 5.10

Permit Condition 5.9 contains spray booth operation requirements, 5.10 contains spray booth filtration system requirements, and 5.11 contains the Operation and Maintenance manual requirement.

Initial Permit Condition 5.12

Permit Condition 5.12 describes a Daily Coating Usage Scenario and requirements for its use.

Initial Permit Condition 5.13

Permit Condition 5.13 lists requirements for proposing or implementing a new Daily Coating Usage Scenario.

Initial Permit Condition 5.14 and 5.15

Permit Condition 5.14 lists steps for calculating TAP emissions for a new or alternate coating to use in a Daily Coating Usage Scenario. Permit Condition 5.15 contains the method for demonstrating TAP compliance with Screening Emission Rates and Modeled Concentration Limits using Table 5.5.

Initial Permit Condition 5.16

Permit Condition 5.16 explains the method for demonstrating compliance with PM₁₀/PM_{2.5}, VOC, and HAP emission limits in Table 5.2.

Initial Permit Condition 5.17

Permit Condition 5.17 contains monitoring and recordkeeping requirements for a Daily Coating Usage Scenario.

Initial Permit Condition 5.18

Permit Condition 5.18 contains daily monitoring and recordkeeping requirements.

Initial Permit Condition 5.19

Permit Condition 5.19 contains annual monitoring and recordkeeping requirements.

Initial Permit Condition 5.20

Permit Condition 5.20 contains requirements for Safety Data Sheet recordkeeping.

Initial Permit Condition 5.21

Permit Condition 5.21 contains requirements for coating usage scenario reporting.

Initial Permit Condition 5.22

Permit Condition 5.22 contains requirements for paint booth filter recordkeeping.

Initial Permit Condition 5.23

Permit Condition 5.23 contains requirements for spray gun recordkeeping.

Initial Permit Condition 5.24

Permit Condition 5.24 contains requirements for odor complaints recordkeeping.

Initial Permit Condition 6.1

The duty to comply general compliance provision requires that the permittee comply with all of the permit terms and conditions pursuant to Idaho Code §39-101.

Initial Permit Condition 6.2

The maintenance and operation general compliance provision requires that the permittee maintain and operate all treatment and control facilities at the facility in accordance with IDAPA 58.01.01.211.

Initial Permit Condition 6.3

The obligation to comply general compliance provision specifies that no permit condition is intended to relieve or exempt the permittee from compliance with applicable state and federal requirements, in accordance with IDAPA 58.01.01.212.01.

Initial Permit Condition 6.4

The inspection and entry provision requires that the permittee allow DEQ inspection and entry pursuant to Idaho Code §39-108.

Initial Permit Condition 6.5

The permit expiration construction and operation provision specifies that the permit expires if construction has not begun within two years of permit issuance or if construction has been suspended for a year in accordance with IDAPA 58.01.01.211.02.

Initial Permit Condition 6.6

The notification of construction and operation provision requires that the permittee notify DEQ of the dates of construction and operation, in accordance with IDAPA 58.01.01.211.03.

Initial Permit Condition 6.7

The performance testing notification of intent provision requires that the permittee notify DEQ at least 15 days prior to any performance test to provide DEQ the option to have an observer present, in accordance with IDAPA 58.01.01.157.03.

Initial Permit Condition 6.8

The performance test protocol provision requires that any performance testing be conducted in accordance with the procedures of IDAPA 58.01.01.157, and encourages the permittee to submit a protocol to DEQ for approval prior to testing.

Initial Permit Condition 6.9

The performance test report provision requires that the permittee report any performance test results to DEQ within 60 days of completion, in accordance with IDAPA 58.01.01.157.04-05.

Initial Permit Condition 6.10

The monitoring and recordkeeping provision requires that the permittee maintain sufficient records to ensure compliance with permit conditions, in accordance with IDAPA 58.01.01.211.

Initial Permit Condition 6.11

The excess emissions provision requires that the permittee follow the procedures required for excess emissions events, in accordance with IDAPA 58.01.01.130-136.

Initial Permit Condition 6.12

The certification provision requires that a responsible official certify all documents submitted to DEQ, in accordance with IDAPA 58.01.01.123.

Initial Permit Condition 6.13

The false statement provision requires that no person make false statements, representations, or certifications, in accordance with IDAPA 58.01.01.125.

Initial Permit Condition 6.14

The tampering provision requires that no person render inaccurate any required monitoring device or method, in accordance with IDAPA 58.01.01.126.

Initial Permit Condition 6.15

The transferability provision specifies that this permit to construct is transferable, in accordance with the procedures of IDAPA 58.01.01.209.06.

Initial Permit Condition 6.16

The severability provision specifies that permit conditions are severable, in accordance with IDAPA 58.01.01.211.

PUBLIC REVIEW

Public Comment Opportunity

An opportunity for public comment period on the application was provided in accordance with IDAPA 58.01.01.209.01.c or IDAPA 58.01.01.404.01.c. During this time, there was a request for a public comment period on DEQ's proposed action. Refer to the chronology for public comment opportunity dates.

Public Comment Period

A public comment period was made available to the public in accordance with IDAPA 58.01.01.209.01.c. During this time, comments were/were not submitted in response to DEQ's proposed action. Refer to the chronology for public comment period dates.

{if comments are received} A response to public comments document has been crafted by DEQ based on comments submitted during the public comment period. That document is part of the final permit package for this permitting action.

2000 lbs/ton
 24.465 liters gas/g-mol gas, at 1 atm, 25°C
 46.0055 g/g-mol, NO₂ molar mass
 453.59 g/lb
 60 min/hr

Notes:

¹ Overall control efficiency combines efficiencies of a water table and partial enclosure. Overall control efficiency calculated based on equation 12.1-2 from EPA EIP Volume II Chapter 12.

Control efficiency for water table based on Hypertherm paper, "Fume Emissions Testing for Plasma Arc Cutting" (February 1999).

Control efficiency of 95% for air filtration system inside building.

² Volume of material removed based on Hypertherm Manual.

³ Emission factors for particulate matter is for plasma/laser arc cutting. Emission factors derived from source test data in Appendix B, 4-24-90, P/C report, A/N 184446, per SCAQMD Honeywell Permit Application #497492.

Nitrogen oxides emission factor from "Emission of Fume, Nitrogen Oxide and Noise in Plasma Cutting of Stainless and Mild Steel" for wet plasma cutting, stainless steel, 35mm thickness.

⁴ Metal content based on specifications provided by Rule Steel.

⁵ Emission Limits for Idaho Toxic Air Pollutants (TAPs) is based on hourly averaged emission rates. For non-carcinogenic TAPs, the averaging period is 24 hours. For carcinogenic TAPs, the averaging period is annual.

Notes

¹ Minimum transfer efficiency for spray painting in booth based on spray gun technical specifications.

² Spray booth PM filter efficiency based on overall areastance efficiency of filter on spray booth:
<http://paintpockets.com/products-paint-pockets.asp>

³ Maximum daily usage based on maximum hourly paint gun throughput and total of 180 gallons/day. Annual Usage is based on projected maximum usage at the facility.

⁴ Total maximum hourly emission rate is maximum emissions from using any one material in one hour. Total emissions for uncontrolled scenario is the maximum of all paints allowed for hourly and annual rates.

⁵ Emission Limits for Idaho Toxic Air Pollutants (TAPs) is based on hourly averaged emission rates. For non-carcinogenic TAPs, the averaging period is 24 hours. For carcinogenic TAPs, the averaging period is annual.

⁶ Pollutant is a HAP, but is not a TAP.

⁷ Naphthalene is listed in the IDAPAS8.01.01 non-carcinogenic TAPs list (Section 585) with a 24-hour average EL of 3.33 lb/hr. Naphthalene is also considered a Poly Aromatic Hydrocarbon (PAH), which is listed on the IDAPAS8.01.01 carcinogenic TAPs list (Section 586) with an annual average EL of 0.000091 lb/hr. DEQ requires comparison of naphthalene emission rates to both carcinogenic and non-carcinogenic ELs.

1.0 Summary

Rule Steel, Inc. (Rule Steel) submitted a Permit to Construct (PTC) application for an initial facility-wide for their existing manufacturing facility near Caldwell, Idaho. This PTC will permit the existing facility and several on-going changes to the facility, including relocation of an existing paint spray booth, construction of another new paint spray booth, and construction of two buildings for metal fabrication processes. Project-specific air quality analyses involving atmospheric dispersion modeling of estimated emissions associated with the proposed modification were submitted to DEQ to demonstrate that emissions increases associated with proposed modification of operations would not cause or significantly contribute to a violation of any applicable ambient air quality standard as required by the Idaho Administrative Procedures Act 58.01.01.203.02 and 203.03 (Idaho Air Rules Section 203.02 and 203.03). This memorandum provides a summary of DEQ's review of the ambient air impact analyses submitted with the permit application.

Ramboll-Environ, Inc. (REI), on behalf of Rule Steel, prepared the PTC application and performed the ambient air impact analyses for this project to demonstrate compliance with applicable National Ambient Air Quality Standards (NAAQS) and Toxic Air Pollutant (TAP) increments. The DEQ review of submitted data and analyses summarized by this memorandum addressed only the rules, policies, methods, and data pertaining to the air impact analyses used to demonstrate that estimated emissions associated with operation of the facility will not cause or significantly contribute to a violation of any applicable air quality standard. This review did not address/evaluate compliance with other rules or analyses not pertaining to the air impact analyses. Evaluation of emissions estimates was the responsibility of the DEQ permit writer and is addressed in the main body of the DEQ Statement of Basis, and emissions calculation methods were not evaluated in this modeling review memorandum.

The submitted information and analyses: 1) showed either a) that estimated potential/allowable emissions are at a level defined as below regulatory concern (BRC) and do not require a NAAQS compliance demonstration, or b) that criteria pollutant emissions increases resulting from the proposed project are below site-specific modeling applicability thresholds, developed to assure that emissions below such levels will not result in ambient air impacts exceeding Significant Impact Levels (SILs); 2) showed that TAP emissions increases associated with the project will not result in increased ambient air impacts exceeding allowable TAP increments.

Table 1 presents key assumptions and results to be considered in the development of the permit.

Idaho Air Rules require air impact analyses be conducted in accordance with methods outlined in 40 CFR 51, Appendix W *Guideline on Air Quality Models* (Appendix W). Appendix W requires that air quality impacts be assessed using atmospheric dispersion models with emissions and operations representative of design capacity or as limited by a federally enforceable permit condition. The submitted information and analyses demonstrated to the satisfaction of the Department that operation of the proposed project will not cause or significantly contribute to a violation of any ambient air quality standard, provided the key conditions in Table 1 are representative of facility design capacity or operations as limited by a federally enforceable permit condition. The DEQ permit writer should use Table 1 and other information presented in this memorandum to generate appropriate permit provisions/restrictions to assure the requirements of Appendix W are met regarding emissions representative of design capacity or permit allowable rates.

Table 1. KEY ASSUMPTIONS USED IN MODELING ANALYSES	
Criteria/Assumption/Result	Explanation/Consideration
General Emissions Rates. Emissions rates used in the air impact analyses, as listed in this memorandum, must represent maximum potential emissions as given by design capacity, inherently limited by the nature of the process or configuration of the facility, or as limited by the issued permit for the specific pollutant and averaging period.	Compliance has not been demonstrated for emissions rates greater than those used in the air impact analyses.
TAP Emissions Sources. TAP emissions sources, as constructed and operated, must be accurately represented by the analyses submitted with the PTC application.	Important parameters include release point locations and release heights.

Summary of Submittals and Actions

- September 27, 2017: REI submitted a modeling protocol on behalf of Rule Steel.
- October 10, 2017: DEQ issued a modeling protocol approval letter for the project.
- October 31, 2017: REI submitted a PTC application to DEQ, on behalf of Rule Steel.
- December 1, 2017: DEQ declared the application incomplete.
- May 1, 2018: DEQ downloaded revised modeling files created by REI on behalf of Rule Steel.
- June 19, 2018: DEQ received a revised emissions inventory and modeling report from REI on behalf of Rule Steel.
- June 25, 2018: DEQ received revised modeling files from REI on behalf of Rule Steel.
- August 10, 2018: DEQ issued a facility draft permit package to Rule Steel.
- September 20, 2018: REI submitted facility draft comments via email to DEQ, including requested revisions to the PTC and a revised EI. Plasma cutting hours of operation were increased and air filtration collection and control systems were added to the facility's requested operations and emissions inventory. REI's information includes a revised emissions control level of 99.95% for PM_{2.5}/PM₁₀, and nickel emitted as particulate matter. This memorandum has been altered to reflect the revised emissions rates submitted with the Rule Steel/REI facility draft comments.
- October 5, 2018: REI submitted additional information confirming plasma cutting emissions collected and controlled by proposed air filtration systems within the plasma cutting building exhaust directly into the building interior. The proposed filtration system is not designed with vents exhausting directly to the atmosphere.

2.0 Background Information

Background information on the project and the air impact analyses was provided in the Modeling Analysis Report submitted with the application.

2.1 Air Impact Analyses Required for All Permits to Construct

Idaho Air Rules Sections 203.02 and 203.03:

No permit to construct shall be granted for a new or modified stationary source unless the applicant shows to the satisfaction of the Department all of the following:

02. NAAQS. The stationary source or modification would not cause or significantly contribute to a violation of any ambient air quality standard.

03. Toxic Air Pollutants. Using the methods provided in Section 210, the emissions of toxic air pollutants from the stationary source or modification would not injure or unreasonably affect human or animal life or vegetation as required by Section 161. Compliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non-carcinogenic increments will also demonstrate preconstruction compliance with Section 161 with regards to the pollutants listed in Sections 585 and 586.

Atmospheric dispersion modeling, using computerized simulations, is used to demonstrate compliance with both NAAQS and TAPs. Idaho Air Rules Section 202.02 states:

02. Estimates of Ambient Concentrations. All estimates of ambient concentrations shall be based on the applicable air quality models, data bases, and other requirements specified in 40 CFR 51 Appendix W (Guideline on Air Quality Models).

2.2 Significant Impact Level and Cumulative NAAQS Impact Analyses

The Significant Impact Level (SIL) analysis for a new facility or proposed modification to a facility involves modeling estimated criteria air pollutant emissions from the facility or modification to determine the potential impacts to ambient air. Air impact analyses are required by Idaho Air Rules to be conducted in accordance with methods outlined in 40 CFR 51, Appendix W (Guideline on Air Quality Models). Appendix W requires that facilities be modeled using emissions and operations representative of design capacity or as limited by a federally enforceable permit condition.

A facility or modification is considered to have a significant impact on air quality if maximum modeled impacts to ambient air exceed the established SIL listed in Idaho Air Rules Section 006 (referred to as a “significant contribution” in Idaho Air Rules) or as incorporated by reference as per Idaho Air Rules Section 107.03.b. Table 2 lists the applicable SILs.

If modeled maximum pollutant impacts to ambient air from the emissions sources associated with a new facility or modification exceed the SILs, then a cumulative NAAQS impact analysis is necessary to demonstrate compliance with NAAQS and Idaho Air Rules Section 203.02.

A cumulative NAAQS impact analysis for attainment area pollutants involves assessing ambient impacts (typically the design values consistent with the form of the standard) from facility-wide potential/allowable emissions, and emissions from any nearby co-contributing sources, and then adding a DEQ-approved background concentration value to the modeled result that is appropriate for the criteria pollutant/averaging-period at the facility location and the area of significant impact. The resulting pollutant concentrations in ambient air are then compared to the NAAQS listed in Table 2. Table 2 also lists SILs and specifies the modeled design value that must be used for comparison to the NAAQS. NAAQS compliance is evaluated on a receptor-by-receptor basis for the modeling domain.

If the cumulative NAAQS impact analysis indicates a violation of the standard, the permit may not be issued if the proposed project has a significant contribution (exceeding the SIL) to the modeled violation. If project-specific impacts are below the SIL, then the project does not have a significant contribution to

the specific violations.

2.3 Toxic Air Pollutant Analyses

Emissions of toxic substances are generally addressed by Idaho Air Rules Section 161:

Any contaminant which is by its nature toxic to human or animal life or vegetation shall not be emitted in such quantities or concentrations as to alone, or in combination with other contaminants, injure or unreasonably affect human or animal life or vegetation.

Permitting requirements for toxic air pollutants (TAPs) from new or modified sources are specifically addressed by Idaho Air Rules Section 203.03 and require the applicant to demonstrate to the satisfaction of DEQ the following:

Using the methods provided in Section 210, the emissions of toxic air pollutants from the stationary source or modification would not injure or unreasonably affect human or animal life or vegetation as required by Section 161. Compliance with all applicable toxic air pollutant carcinogenic increments and toxic air pollutant non-carcinogenic increments will also demonstrate preconstruction compliance with Section 161 with regards to the pollutants listed in Sections 585 and 586.

Pollutant	Averaging Period	Significant Impact Levels^a (µg/m³)^b	Regulatory Limit^c (µg/m³)	Modeled Design Value Used^d

-
- a. Idaho Air Rules Section 006 (definition for significant contribution) or as incorporated by reference as per Idaho Air Rules Section 107.03.b.
 - b. Micrograms per cubic meter.
 - c. Incorporated into Idaho Air Rules by reference, as per Idaho Air Rules Section 107.
 - d. The maximum 1st highest modeled value is always used for the significant impact analysis unless indicated otherwise. Modeled design values are calculated for each ambient air receptor.
 - e. Particulate matter with an aerodynamic diameter less than or equal to a nominal 10 micrometers.
 - f. Not to be exceeded more than once per year on average over 3 years.
 - g. Concentration at any modeled receptor when using five years of meteorological data.
 - h. Particulate matter with an aerodynamic diameter less than or equal to a nominal 2.5 micrometers.
 - i. 3-year mean of the upper 98th percentile of the annual distribution of 24-hour concentrations.
 - j. 5-year mean of the 8th highest modeled 24-hour concentrations at the modeled receptor for each year of meteorological data modeled. For the SIL analysis, the 5-year mean of the 1st highest modeled 24-hour impacts at the modeled receptor for each year.
 - k. 3-year mean of annual concentration.
 - l. 5-year mean of annual averages at the modeled receptor.
 - m. Not to be exceeded more than once per year.
 - n. Concentration at any modeled receptor.
 - o. Interim SIL established by EPA policy memorandum.
 - p. 3-year mean of the upper 99th percentile of the annual distribution of maximum daily 1-hour concentrations.
 - q. 5-year mean of the 4th highest daily 1-hour maximum modeled concentrations for each year of meteorological data modeled. For the significant impact analysis, the 5-year mean of 1st highest modeled 1-hour impacts for each year is used.
 - r. Not to be exceeded in any calendar year.
 - s. 3-year mean of the upper 98th percentile of the annual distribution of maximum daily 1-hour concentrations.
 - t. 5-year mean of the 8th highest daily 1-hour maximum modeled concentrations for each year of meteorological data modeled. For the significant impact analysis, the 5-year mean of maximum modeled 1-hour impacts for each year is used.
 - u. 3-month rolling average.
 - v. An annual emissions rate of 40 ton/year of VOCs is considered significant for O₃.
 - w. Annual 4th highest daily maximum 8-hour concentration averaged over three years.

Per Section 210, if the total project-wide emissions increase of any TAP associated with a new source or modification exceeds screening emission levels (ELs) of Idaho Air Rules Section 585 or 586, then the ambient impact of the emissions increase must be estimated. If ambient impacts are less than applicable Acceptable Ambient Concentrations (AACs) for non-carcinogens of Idaho Air Rules Section 585 and Acceptable Ambient Concentrations for Carcinogens (AACCs) of Idaho Air Rules Section 586, then compliance with TAP requirements has been demonstrated.

Idaho Air Rules Section 210.20 states that if TAP emissions from a specific source are regulated by the Department or EPA under 40 CFR 60, 61, or 63, then a TAP impact analysis under Section 210 is not required for that TAP.

3.0 Analytical Methods and Data

The submitted modeling report provides a detailed discussion of the methods and data used to demonstrate compliance with applicable standards. The purpose of the application was to issue a facility-wide PTC for existing operations. There are no proposed physical changes to the facility.

3.1 Emission Source Data

Emissions increases of criteria pollutants and TAPs resulting from the proposed project were estimated by REI for various applicable averaging periods.

Emissions rates used in the dispersion modeling analyses, as listed in this memorandum, should be reviewed by the DEQ permit writer and compared with those in the final emissions inventory. All modeled criteria air pollutant and TAP emissions rates must be equal to or greater than the modification's potential emissions increase calculated in the PTC emissions inventory or proposed permit allowable emissions rates.

3.1.1 Modeling Applicability and Modeled Criteria Pollutant Emissions Rates

If project-specific emission increases for criteria pollutants would qualify for a below regulatory concern (BRC) permit exemption as per Idaho Air Rules Section 221 if it were not for potential emissions of one or more pollutants exceeding the BRC threshold of 10 percent of emissions defined by Idaho Air Rules as significant, then a NAAQS compliance demonstration may not be required for those pollutants with emissions below BRC levels. DEQ's regulatory interpretation policy of exemption provisions of Idaho Air Rules is that: "A DEQ NAAQS compliance assertion will not be made by the DEQ modeling group for specific criteria pollutants having a project emissions increase below BRC levels, provided the proposed project would have qualified for a Category I Exemption for BRC emissions quantities except for the emissions of another criteria pollutant."¹ The interpretation policy also states that the exemption criteria of uncontrolled potential to emit (PTE) not to exceed 100 ton/year (Idaho Air Rules Section 220.01.a.i) is not applicable when evaluating whether a NAAQS impact analyses is required. A permit will be issued limiting PTE below 100 ton/year, thereby negating the need to maintain calculated uncontrolled PTE under 100 ton/year. The BRC exemption cannot be used to exempt a project from a pollutant-specific NAAQS compliance demonstration in cases where a PTC is required for the action regardless of emissions quantities, such as the modification of an existing emissions or throughput limit.

A NAAQS compliance demonstration must be performed for pollutant increases that would not qualify for the BRC exemption from the requirement to demonstrate compliance with NAAQS. NAAQS compliance demonstrations were not required for this project since the submitted application demonstrated that the project qualified for the BRC NAAQS compliance demonstration exemption.

Site-specific air impact modeling analyses may not be necessary for some pollutants, even where such emissions do not qualify for the BRC exemption. DEQ has developed modeling applicability thresholds, below which a site-specific modeling analysis is not required. DEQ generic air impact modeling analyses that were used to develop the modeling thresholds provide a conservative SIL analysis for projects with emissions below identified threshold levels. Project-specific modeling applicability thresholds are provided in the *Idaho Air Modeling Guideline*². These thresholds were based on assuring an ambient impact of less than the established SIL for specific pollutants and averaging periods.

If project-specific total emissions rate increases of a pollutant are below Level I Modeling Applicability Thresholds, then project-specific air impact analyses are not necessary for permitting. Use of Level II Modeling Applicability Thresholds are conditional, requiring DEQ approval. DEQ approval is based on dispersion-affecting characteristics of the emissions sources such as stack height, stack gas exit velocity, stack gas temperature, distance from sources to ambient air, presence of elevated terrain, and potential exposure to sensitive public receptors.

Use of Modeling Applicability Thresholds were not used by REI since NAAQS compliance demonstrations were not required because total facility-wide emissions were below BRC levels. Table 3 provides a comparison between facility-wide allowable emissions and BRC levels.

Table 3. NAAQS COMPLIANCE DEMONSTRATION APPLICABILITY ANALYSIS RESULTS			
Pollutant	Annual Allowable Emissions^a (tons/year)	BRC Level (tons/year)	NAAQS Compliance Demonstration Required
PM _{2.5}	0.57	1.0	No
PM ₁₀	0.91	1.5	No
NO _x	3.99	4	No
CO	0.38	10	No
SO ₂	0.08	4	No
Pb	1.04E-04	0.06	No

^a. As stated in the application materials.

Ozone (O₃) differs from other criteria pollutants in that it is not typically emitted directly into the atmosphere. O₃ is formed in the atmosphere through reactions of VOCs, NO_x, and sunlight. Atmospheric dispersion models used in stationary source air permitting analyses cannot be used to estimate O₃ impacts resulting from VOC and NO_x emissions from an industrial facility. O₃ concentrations resulting from area-wide emissions are predicted by using more complex airshed models such as the Community Multi-Scale Air Quality (CMAQ) modeling system. Use of the CMAQ model is very resource intensive and DEQ asserts that performing a CMAQ analysis for a particular permit application is not typically a reasonable or necessary requirement for air quality permitting. Addressing secondary formation of O₃ within the context of permitting a new stationary source has been somewhat addressed in EPA regulation and policy. As stated in a letter from Gina McCarthy of EPA to Robert Ukeiley, acting on behalf of the Sierra Club (letter from Gina McCarthy, Assistant Administrator, United States Environmental Protection Agency, to Robert Ukeiley, January 4, 2012):

... footnote 1 to sections 51.166(I)(5)(I) of the EPA's regulations says the following: "No de minimis air quality level is provided for ozone. However, any net emission increase of 100 tons per year or more of volatile organic compounds or nitrogen oxides subject to PSD would be required to perform an ambient impact analysis, including the gathering of air quality data."

The EPA believes it unlikely a source emitting below these levels would contribute to such a violation of the 8-hour ozone NAAQS, but consultation with an EPA Regional Office should still be conducted in accordance with section 5.2.1.c. of Appendix W when reviewing an application for sources with emissions of these ozone precursors below 100 TPY."

DEQ determined it was not appropriate or necessary to require a quantitative source specific O₃ impact analysis because allowable emissions estimates of VOCs and NO_x are below the 100 tons/year threshold.

Secondary Particulate Formation

The impact from secondary particulate formation resulting from emissions of NO_x, SO₂, and/or VOCs was assumed by DEQ to be negligible based on the magnitude of emissions and the short distance from emissions sources to locations where maximum PM₁₀ and PM_{2.5} impacts are anticipated.

3.1.2 Toxic Air Pollutant Emissions Rates

TAP emissions regulations under Idaho Air Rules Section 210 are only applicable to new or modified sources constructed after July 1, 1995.

Table 4 provides a summary of TAP emissions increases for the project for those TAPs that had an increase exceeding the ELs of Idaho Air Rules Section 585 or 586. Tables 5 and 6 lists source-specific emissions of non-carcinogenic and carcinogenic TAPs, respectively, used in the impact analyses.

Toxic Air Pollutant	Emissions (lb/hr) ^a	Screening Emissions Level (lb/hr)
Dibutyl phthalate ^b	1.76	0.333
Heptano-2-one (2-heptanone, see methyl n-amyl ketone) ^b	52.4	15.7
o-Xylene & Xylene (aggregated emission rates) ^b	47.5	29
Naphthalene (as a carcinogen) ^{c, d}	3.7E-03	9.1E-05
Nickel ^c	1.20E-04	2.7E-05

^a. Pounds per hour.

^b. Non-carcinogenic TAP. ELs are daily maximum emissions expressed as pounds/hour. The emissions rate is the daily emissions divided by 24 hours/day.

^c. Carcinogenic TAP. ELs are annual maximum emissions expressed as pounds/hour. The emissions rate is the annual emissions divided by 8,760 hours/year.

^d. DEQ-required treatment of naphthalene as a carcinogenic polyaromatic hydrocarbon (PAH).

^a The emissions rate is the total annual emissions divided by 8,760 hours/year for carcinogenic TAPs.

^b Submitted modeling demonstration modeled this emission rate.

^c September 20, 2018 revised emission rate. This rate is lower than included in Rule Steel's modeling demonstration, so modeled impacts are conservative.

3.1.3 DEQ Review

DEQ determined the following from review of the Air Modeling Analysis Report submitted with the application:

- The appropriate atmospheric dispersion model was used for the proposed project.
- The Rule Steel facility was properly represented in the model, regarding geographical location, terrain, structures, emission point locations, and areas of potential exposure.
- Appropriate meteorological data were used with the dispersion model.
- Appropriate averaging periods were selected for model output, corresponding to the form of applicable standards.
- The modeling report indicates that all TAPs with project-wide emissions increases above the ELs of Idaho Air Rules Section 585 and 586 were modeled to evaluate compliance with applicable AACs and AACCs.
- Through review of the submitted Air Modeling Analysis Report, it appears that the TAPs air impact analyses were performed using recommended data and methods prescribed in the *Idaho Air Quality Modeling Guideline*¹.

DEQ determined the review of the air impact analyses, as described above, was adequate to provide assurance that the proposed project will not result in increases in ambient air TAP levels that exceeded the specific AACs or AACCs. This conclusion is based on the general type and magnitude of the facility, the types of methods and data used in the analyses, and the modeled results in comparison to applicable AACs/AACCs.

4.0 NAAQS and TAPs Air Impact Modeling Results

4.1 Results for NAAQS Analyses

A NAAQS compliance demonstration was not required for permit issuance because facility-wide emissions of criteria pollutants were below BRC levels.

4.2 Results for TAPs Impact Analyses

Table 7 lists the maximum modeled impacts for specific TAPs. All modeled impacts are below applicable AACs and AACCs.

Table 7. TAP AIR IMPACT ANALYSIS RESULTS				
TAP	Averaging Period	Maximum Modeled Impact ($\mu\text{g}/\text{m}^3$)^a	AAC or AACC ($\mu\text{g}/\text{m}^3$)	Percent of AAC/AACC
Dibutyl phthalate ^b	24-hour	24.94	250	10%
Heptano-2-one ^b	24-hour	741.34	11,750	6%
o-Xylene & Xylene ^b	24-hour	673.94	21,750	3%
Naphthalene (as a carcinogen) ^c	Annual	0.01375	0.014	98%
Nickel ^c	Annual	<0.00357 ^d	0.0042	<85% ^d

^{a.} Micrograms per cubic meter.

^{b.} Non-carcinogenic TAP. Modeled impact and AAC represent a 24-hour averaged concentration.

^{c.} Carcinogenic TAP. Modeled impact and AACC represent an 8,760-hour averaged concentration.

^{d.} Rule Steel did not revise the ambient impact analyses to account for reduced emission rates of nickel originating in facility draft comments, edits, and equipment change requests. Reduced plasma cutting emission rates

5.0 Conclusions

The information submitted with the PTC application demonstrated to DEQ's satisfaction that applicable emissions resulting from the Rule Steel facility will not cause or significantly contribute to a violation of any ambient air quality standard or TAP increment.

APPENDIX C – FACILITY DRAFT COMMENTS

The following comments were received from the facility on September 20, 2018:

Facility Comment:

1. Increase hours of operation for plasma cutting. A careful review of the draft permit indicates the limit on plasma cutting operations unnecessarily constrains operations and needs to be updated for potential future operations. Rule Steel requests plasma cutting operations be limited to 6,100 hours per year of operation. This level is representative of current volume and allows for expected growth in operations.

2. Air filters controlling plasma cutting emissions. Rule Steel plans to install up to 14 air filtration systems that will control particulate matter emissions from plasma cutting by more than 95 percent. Additional information on the air filtration systems and a summary of attachments to this email are provided below.

- Each air filtration system will handle over 6,000 cfm of air from the cutting building through two filters (CI Sure Shield MERV-11 filter and Defiant MERV-15 filter). Literature on control efficiencies for both filters are attached to this email, and indicate particulate matter control efficiencies greater than 95% for small particulate and greater than 95 percent for PM10.
- The addition of an air filtration system will reduce particulate matter and toxic air pollutant (TAP) emissions from plasma cutting operations. Therefore, no additional modeling is necessary to incorporate the air filtration system.
- Updated Idaho DEQ forms for the plasma cutting tables and an updated emission inventory are attached to this email.
- Rule Steel has proposed additional permit conditions for the operation and maintenance of the filtration systems in the draft PTC.

3. Requirement for closed doors. This proposal is unrepresentative of normal operations and cannot be implemented continuously by Rule Steel. Doors are closed for quality and certification purposes during welding; however the 1-hour delay to move product is unworkable. Rule Steel requests Idaho DEQ remove Conditions 2.9 and 3.5 (1-Hour Closed Door Requirement) based on the fact the proposed air filtration system will provide a higher level of control for plasma cutting activities and the roll-up doors are closed during welding activities in order to perform high-quality welding according to the American Welding Society (AWS) and American Society of Mechanical Engineering (ASME) codes. These codes impose strict limitations on wind disturbance within a welding environment. The requirements prevent wind from evacuating the shielding gas (i.e., carbon dioxide or argon) used to protect the weld area from oxygen and water vapor. This practice ensures high-quality welds. Rule Steel has four AWS-certified weld inspectors that routinely verify weld quality and the operating environment across the facility. Inspections include checking dew points and air movement during welding operations. No welding can occur when the building doors are open to ensure conformity with these applicable codes.

4. Propane Heater Usage. The initial PTC application assumed continuous propane heater usage (8,760 hours per year), but actual propane needs are much lower based on seasonal requirements for worker comfort heating. Based on past operations, we have assumed a maximum of 6,000 hours per year of operation.

DEQ Response: The emission inventory and PTE tables in the Statement of Basis were updated. Added the new AZTech filtration system to the Control Devices sections of permit Tables 1.1 and 2.1. Increased Abrasive Blasting permit limits, accordingly. Added permit conditions for the filtration system and filtration system O&M manual. The Welding closed door requirement was updated.

Facility Comment:

5. Alternative Daily Coating Usage. Draft PTC Condition 5.14 contains language requiring TAP content to be based on 1% of the coating density for TAPs that were not detected in the coating or 100% of the coating density when information on the TAP is not available. These assumptions would result in unreasonable TAP emission estimates from alternative coatings. For TAPs that are not measurable in a coating (i.e., not detected), assuming mass concentration is not reasonable. Idaho DEQ's approach may be more reasonable for TAPs that were measurable but below the method detection limit. However, Rule Steel requests the draft permit language be removed for TAPs that are not measurable in an alternative coating.

DEQ Response: The Alternate Daily Coating Usage Scenario permit option has been developed by DEQ was included in this permit to provide the facility added flexibility for qualifying new or different coatings that are not listed in the facility's current permit. DEQ has determined that qualification of TAPs using the methodology listed in the Alternate Daily Coating Usage Scenario section ensures compliance with Idaho Air Rules TAPs requirements specified in IDAPA 58.01.01. 210, 585, and 586. Alternatively, the facility may also submit a new PTC application to qualify and incorporate new coatings into its permit.

Facility Comment: The facility requested changing Emission Points in Operation Description Tables 2.1, 3.1 and 4.1 in Plasma Cutting, Welding, and Abrasive Blasting permit sections to fugitive emissions.

DEQ Response: These sections are left unchanged since emissions from these operations do not meet the definition of fugitive emissions in IDAPA 58.01.01.006(47): *Those emissions which could not reasonably pass through a stack, chimney, vent, or other functionally equivalent opening.*

Facility Comment: Table 5.2 Emission limit for Individual TAP (T/yr) updated to 8.03: Updated for Xylene calculation. Also the facility added corrections to incorrect Table 5.2 footnote (f) references.

DEQ Response: Corrected Table 5.2 emission limits from T/yr to lb/day to for consistency with calculations methods described in Permit Condition 5.16. This is consistent with use of the Alternate Daily Coating Usage Scenario.

Facility Comment: The facility added "equivalent coating(s)" to original wording "approved coatings".

DEQ Response: Use of the Alternate Daily Coating Usage sections of the permit define a method to qualify coatings for use without incorporating them into the permit. Adding the wording "equivalent" convolutes the
