Use Attainability Analysis – Point by Point

- > The designated use of a water body may be changed only if it is documented that the use is not attainable. This documentation is called a use attainability analysis (UAA).
- ➤ A UAA is a structured scientific assessment of the beneficial uses a water body can support. The analysis needs to identify the highest use the water body in questions can attain given application of required effluent limits and implementation of cost-effective and reasonable best management practices. This can be difficult and contentious.
- ➤ In no case may a use that currently exists, or has existed since Nov. 28, 1975, be removed or downgraded.
- > Furthermore, the CWA requires that the existing use become the designated use, or the water's designation upgraded, for waters whose existing use is better than currently designated.
- ➤ Federal Regulations (40CFR 131.10(g)) allows only six reasons for changing a use designation:
 - 1) Naturally occurring pollutant levels prevent attainment;
 - 2) Natural ephemeral, intermittent, or low flow prevents attainment;
 - 3) Human caused pollution prevents attainment <u>and</u> cannot be remedied without causing worse environmental harm;
 - 4) Dams, diversions, and other hydrologic modifications prevent attainment <u>and</u> it is not feasible to restore the water or operate the modification in a way that would result in attainment;
 - 5) Natural physical features prevent attainment;
 - 6) Attainment requires controls more stringent than effluent limitations or new source performance standards and these extraordinary controls would result in substantial <u>and</u> widespread social and economic hardship.
- > Any proposed use change requires rulemaking to be put in place and must include opportunity for public comment.
- ➤ Use changes are subject to EPA review and approval before being effective for CWA purposes (discharge permits, total maximum daily loads, 303(d) listing decisions).
- > A UAA is required anytime a state or tribe designates a use that does not include the "fishable swimmable" goals of the CWA <u>or</u> changes a use to one that would apply less stringent criteria.
- Experience is that UAAs are costly and time consuming. In addition to documenting the existing uses, a UAA must also determine the uses that are attainable, with pollution control.
- > Because the directive of the CWA is to restore and maintain the integrity of the nation's waters, use changes are treated with great circumspection the standard or proof is high.
